

Micropower Voltage Detector

Features

- **MCP111**: Passes AEC-Q100 Reliability Testing
- Ultra-Low Supply Current: 1.75 μ A (Max.)
- Precision Monitoring Options Of:
 - 1.90V, 2.32V, 2.63V, 2.90V, 2.93V, 3.08V, 4.38V and 4.63V
- Resets Microcontroller in a Power-Loss Event
- Active-Low V_{OUT} Pin:
 - **MCP111** Active-Low, Open-Drain
 - **MCP112** Active-Low, Push-Pull
- Available in SOT23-3, TO-92, SC-70 and SOT-89-3 Packages
- Temperature Range:
 - Extended: -40°C to $+125^{\circ}\text{C}$ (except MCP1XX-195)
 - Industrial: -40°C to $+85^{\circ}\text{C}$ (MCP1XX-195 Only)
- Pb-Free Devices

Applications

- Critical Microcontroller and Microprocessor Power-Monitoring Applications
- Computers
- Intelligent Instruments
- Portable Battery-Powered Equipment

General Description

The MCP111/112 are voltage-detecting devices designed to keep a microcontroller in reset until the system voltage has stabilized at the appropriate level for reliable system operation. These devices also operate as protection from brown-out conditions when the system supply voltage drops below the specified threshold voltage level. Eight different trip voltages are available.

4.0 APPLICATION INFORMATION

For many of today's microcontroller applications, care must be taken to prevent low-power conditions that can cause many different system problems. The most common causes is a brown-out condition, where the system supply drops below the operating level momentarily. The second most common cause is when a slowly decaying power supply causes the microcontroller to begin executing instructions without sufficient voltage to sustain SRAM, thus producing indeterminate results. Figure 4-1 shows a typical application circuit.

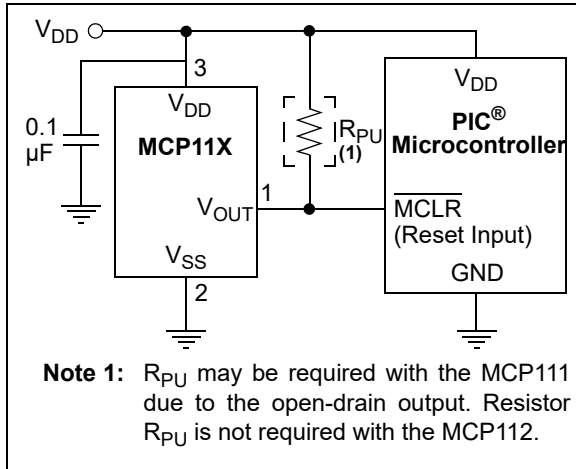

FIGURE 4-1: Typical Application Circuit.

4.1 V_{TRIP} Operation

The voltage trip point (V_{TRIP}) is determined on the falling edge of V_{DD} . The actual voltage trip point (V_{TRIPAC}) will be between the minimum trip point ($V_{TRIPMIN}$) and the maximum trip point ($V_{TRIPMAX}$). There is a hysteresis on this trip point to remove any "jitter" that would occur on the V_{OUT} pin when the device V_{DD} is at the trip point.

Figure 4-2 shows the state of the V_{OUT} pin as determined by the V_{DD} voltage. The V_{TRIP} specification is for falling V_{DD} voltages. When the V_{DD} voltage is rising, the V_{OUT} pin will not be driven high until V_{DD} is at $V_{TRIP} + V_{HYS}$.

FIGURE 4-2: V_{OUT} Operation as Determined by the V_{TRIP} and V_{HYS} .

MCP111/112

4.2 Negative Going V_{DD} Transients

The minimum pulse width (time) required to cause a reset may be an important criteria in the implementation of a Power-on Reset (POR) circuit. This time is referred to as transient duration, defined as the amount of time needed for these supervisory devices to respond to a drop in V_{DD} . The transient duration time is dependent on the magnitude of $V_{TRIP} - V_{DD}$. Generally speaking, the transient duration decreases with increases in $V_{TRIP} - V_{DD}$.

Figure 4-3 shows a typical transient duration vs. reset comparator overdrive for which the MCP111/112 will not generate a reset pulse. It shows that the farther below the trip point the transient pulse goes, the duration of the pulse required to cause a reset gets shorter. Figure 2-18 shows the transient response characteristics for the MCP111/112.

A 0.1 μF bypass capacitor, mounted as close as possible to the V_{DD} pin, provides additional transient immunity (refer to Figure 4-1).

FIGURE 4-3: Example of Typical Transient Duration Waveform.

4.3 Effect of Temperature on Time-Out Period (t_{RPU})

The time-out period (t_{RPU}) determines how long the device remains in the reset condition. This is affected by both V_{DD} and temperature. The graph shown in Figures 2-22, 2-23 and 2-24 show the typical response for different V_{DD} values and temperatures.

4.4 Using in PIC[®] Microcontroller ICSP[™] Applications (MCP111 only)

Figure 4-4 shows the typical application circuit for using the MCP111 for voltage supervisory function when the PIC microcontroller will be programmed via the In-Circuit Serial Programming[™] (ICSP) feature. Additional information is available in TB087, "Using Voltage Supervisors with PIC[®] Microcontroller Systems which Implement In-Circuit Serial Programming[™]", DS91087.

Note: It is recommended that the current into the $\overline{\text{RST}}$ pin be current limited by a 1 k Ω resistor.

NOTES:

APPENDIX A: REVISION HISTORY

Revision G (November 2022)

- Updated document layout.
- Added automotive qualification to [Features](#) and examples to [Product Identification System](#).
- Updated [Absolute Maximum Ratings](#) and [Section 5.0 “Packaging information”](#).

Revision F (July 2016)

- Updated [Table 3-1](#).
- Updated [Section 5.0 “Packaging information”](#).
- Minor typographical corrections.

Revision E (January 2013)

- Added a note to each package outline drawing.

Revision D (June 2005)

- Added SOT-89-3 package information throughout.

Revision C (March 2005)

- Added [Section 4.4 “Using in PIC® Microcontroller ICSP™ Applications \(MCP111 only\)”](#) on using the MCP111 in PIC microcontroller ICSP applications.
- Added V_{ODH} specifications in [Section 1.0 “Electrical Characteristics”](#) (for ICSP applications).
- Added Figure 2-28.
- Added devices features table to page 1.
- Updated SC-70 package markings and added Pb-free marking information to [Section 5.0 “Packaging information”](#).
- Added [Appendix A: “Revision History”](#).

Revision B (August 2004)

- Corrected package marking information in [Section 5.0 “Packaging information”](#).

Revision A (May 2004)

- Original release of this document.

NOTES:

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable" Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications.
