**Single-Channel: 6N137M,  
HCPL2601M, HCPL2611M  
Dual-Channel: HCPL2630M,  
HCPL2631M**

## Description

The 6N137M, HCPL2601M, HCPL2611M single-channel and HCPL2630M, HCPL2631M dual-channel optocouplers consist of a 850 nm AlGaAs LED, optically coupled to a very high speed integrated photo-detector logic gate with a strobable output. This output features an open collector, thereby permitting wired OR outputs. The switching parameters are guaranteed over the temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . A maximum input signal of 5 mA will provide a minimum output sink current of 13 mA (fan out of 8).

An internal noise shield provides superior common mode rejection of typically 10 kV/ $\mu\text{s}$ . The HCPL2601M and HCPL2631M has a minimum CMR of 5 kV/ $\mu\text{s}$ . The HCPL2611M has a minimum CMR of 10 kV/ $\mu\text{s}$ .

4. Enable Input – No pull up resistor required as the device has an internal pull up resistor.
5.  $t_{PHL}$  – Propagation delay is measured from the 3.75 mA level on the LOW to HIGH transition of the input current pulse to the 1.5 V level on the HIGH to LOW transition of the output voltage pulse.
6.  $t_{PLH}$  – Propagation delay is measured from the 3.75 mA level on the HIGH to LOW transition of the input current pulse to the 1.5 V level on the LOW to HIGH transition of the output voltage pulse.
7.  $t_R$  – Rise time is measured from the 10% to the 90% levels on the LOW to HIGH transition of the output pulse.
8.  $t_F$  – Fall time is measured from the 90% to the 10% levels on the HIGH to LOW transition of the output pulse.
9.  $t_{EHL}$  – Enable input propagation delay is measured from the 1.5 V level on the LOW to HIGH transition of the input voltage pulse to the 1.5 V level on the HIGH to LOW transition of the output voltage pulse.
10.  $t_{ELH}$  – Enable input propagation delay is measured from the 1.5 V level on the HIGH to LOW transition of the input voltage pulse to the 1.5 V level on the LOW to HIGH transition of the output voltage pulse.
11. Common mode transient immunity in logic high level is the maximum tolerable (positive)  $dV_{cm}/dt$  on the leading edge of the common mode pulse signal,  $V_{CM}$ , to assure that the output will remain in a logic high state (i.e.,  $V_O > 2.0\text{ V}$ ). Common mode transient immunity in logic low level is the maximum tolerable (negative)  $dV_{cm}/dt$  on the trailing edge of the common mode pulse signal,  $V_{CM}$ , to assure that the output will remain in a logic low state (i.e.,  $V_O < 0.8\text{ V}$ ).
12. Device is considered a two terminal device: pins 1, 2, 3 and 4 are shorted together and pins 5, 6, 7 and 8 are shorted together.
13. 5000  $VAC_{RMS}$  for 1 minute duration is equivalent to 6000  $VAC_{RMS}$  for 1 second duration
